

Reviewer ~B

As part of my internship duties, I served as a code reviewer responsible for ensuring that both backend and frontend components met project standards. My work focused on identifying errors, improving code quality, enforcing security practices, and verifying functionality across all modules.

Key Tasks

- Reviewed all API endpoints for correctness and stability.
- Detected and corrected database query errors such as incorrect cursor usage and SQL syntax issues.
- Cleaned up redundant exception handling blocks to improve readability and maintainability.
- Verified that locking logic correctly prevents modifications to approved records.
- Checked for hardcoded values and recommended dynamic replacements for better flexibility.
- Ensured environment configuration was properly handled:
 - Confirmed no sensitive data was hardcoded.
 - Recommended creation of `.env.example` with placeholders for database and email settings.
 - Verified `.env` inclusion in `.gitignore` to protect credentials.
- Conducted daily re-reviews after fixes were pushed.
- Verified that previous comments were addressed and marked them as **“Resolved”** when corrected.
- Added new comments with exact file and line references when new issues were found.
- Ensured all reviews were completed by the set deadline.
- Communicated review outcomes clearly — either approval or a list of remaining blockers.
- Maintained code quality and consistency across backend and frontend.
- Strengthened project security by enforcing environment variable usage.
- Verified business logic and data flow between systems.
- Provided structured, actionable feedback with clear technical reasoning.

Through systematic code reviews, error detection, and process documentation, I ensured the project met technical and security standards. My contributions helped maintain a stable, organized, and professional codebase ready for deployment.
